## **CLAIM AMENDMENTS:**

## 1-6 cancelled

7. (new) A piston pin bushing comprising:

a brass alloy having between 30 and 32.2 weight % of zinc, 1.8 to 2.2 weight % of aluminium, 1.8 to 2.2 weight % of manganese, 1.4 to 2.2 weight % of nickel, 1.4 to 2.0 weight % of iron, contaminant-related constituents with a respective maximum content of 0.2 weight % and a maximum total content of 1 weight %, the rest copper, wherein the piston pin bushing is cut as a longitudinal section from a continuously cast pipe whose exterior has been previously machined, and is used without being subjected to a forging process following cutting.

- 8. (new) The piston pin bushing of claim 7, wherein said brass alloy comprises between 1.8 and 2.2 weight % of nickel.
- 9. (new) The piston pin bushing of claim 7, wherein said brass alloy comprises between 1.6 and 2.2 weight % of iron.
- 10. (new) The piston pin bushing of claim 7, wherein the bushing has an outer diameter of between 20 and 50 mm.
- 11. (new) The piston pin bushing of claim 7, wherein the bushing has a wall thickness of between 1 and 4 mm.
- 12. (new) A method for producing a piston pin bushing, the method comprising the steps of:

- a) preparing a brass alloy having between 30 and 32.2 weight % of zinc, 1.8 to 2.2 weight % of aluminium, 1.8 to 2.2 weight % of manganese, 1.4 to 2.2 weight % of nickel, 1.4 to 2.0 weight % of iron, contaminant-related constituents with a respective maximum content of 0.2 weight % and a maximum total content of 1 weight %, and the rest copper;
- b) continuously casting the brass alloy to form a tubular body;
- c) machining the exterior of the tubular body, and
- d) cutting a longitudinal section from the tubular body, without forging following cutting, to form the piston pin bushing.
